

GL Government Diagnostic Task Force Framework

Purpose

The GL Government Diagnostic Task Force is an independent outcome verification and governance diagnostics structure designed to identify whether public systems actually improved citizen outcomes after implementation.

This framework is not:

- IT implementation consulting
- Vendor QA
- UX cosmetic review
- Internal agency self-evaluation
- Dashboard reporting

This framework exists to answer one question:

Did the system improve real-world public outcomes after deployment?

Core Mission

The task force investigates:

- Administrative friction
- False digitization
- Outcome invisibility
- Workflow burden
- AI amplification of procedural error
- Procurement acceptance gaps
- Citizen trust collapse caused by operational design

The task force operates independently from:

- implementation vendors
 - procurement contractors
 - system integrators
 - software providers
 - internal political communications teams
-

Foundational Principle

Technical Completion Does Not Equal Public Success

A system may:

- launch successfully
- pass technical acceptance
- meet contract deliverables
- satisfy implementation milestones

while simultaneously:

- increasing citizen burden
- amplifying delays
- generating inaccessible workflows
- creating invisible administrative failure
- reducing public trust

The GL framework exists to measure this hidden layer.

Independent Positioning

The Task Force Is Not Part of the Vendor Ecosystem

The diagnostic team:

- does not implement systems
- does not resell software
- does not receive vendor commissions
- does not participate in procurement scoring
- does not modify findings for political convenience

The task force functions as:

Independent Outcome Verification Infrastructure.

GL Diagnostic Methodology

Core Formula

$$GL = F_s \times V_n / (P_d \times C_f)$$

Where:

- F_s = Friction Severity
- V_n = Volume Normalization
- P_d = Process Density
- C_f = Completion Fluidity

The formula evaluates operational burden and governance friction through observable system behavior.

Five-Layer Diagnostic Structure

Layer 1 — Workflow Mapping

The task force documents:

- citizen journey
- required actions
- handoffs
- document requests
- repetitive verification points
- queue structures
- escalation points

Deliverable:

- workflow decomposition map
-

Layer 2 — Friction Extraction

The task force identifies:

- redundant steps
- duplicated data entry
- unnecessary PDF uploads
- inaccessible interfaces
- repeated authentication burdens
- unclear procedural logic
- invisible rejection mechanisms

Deliverable:

- friction matrix
-

Layer 3 — False Digitization Detection

The task force determines whether:

- the system truly processes information
- or merely digitizes paperwork movement

Indicators include:

- uploaded PDFs that are not machine-readable
- manual re-entry after digital upload
- portalized paper workflows
- digital forms routed into manual review queues
- duplicated verification after submission

Deliverable:

- false digitization scorecard
-

Layer 4 — Outcome Verification

The task force evaluates measurable change after deployment.

Examples:

- processing time
- completion rate
- abandonment rate
- error rate
- appeal rate
- citizen response burden
- service activation speed
- staff escalation frequency

Deliverable:

- before/after outcome report
-

Layer 5 — Governance Risk Review

The task force identifies structural governance risks.

Examples:

- vendor self-verification
- procurement acceptance gaps
- invisible operational failures
- AI placement errors
- accountability fragmentation
- non-auditable workflow logic

Deliverable:

- governance risk assessment
-

90-Day Rapid Diagnostic Model

Phase 1 — Intake (Week 1-2)

Activities:

- stakeholder interviews
- workflow collection
- public complaint review
- system entry-point review
- metrics collection

Outputs:

- diagnostic scope
 - operational baseline
-

Phase 2 — Field Observation (Week 3-6)

Activities:

- live workflow testing
- citizen simulation
- friction observation
- process decomposition
- service pathway mapping

Outputs:

- friction extraction report
- workflow map

Phase 3 — Outcome Measurement (Week 7–10)

Activities:

- before/after comparison
- burden quantification
- operational consistency testing
- escalation analysis

Outputs:

- GL scoring analysis
 - outcome visibility report
-

Phase 4 — Independent Findings (Week 11–12)

Activities:

- governance review
- procurement alignment analysis
- recommendations
- executive briefing

Outputs:

- final verification report
 - procurement risk findings
 - reform recommendations
-

Standard Deliverables

Executive Brief

Short summary for leadership.

Includes:

- core findings
 - critical risks
 - operational consequences
 - recommended actions
-

GL Diagnostic Report

Formal analytical report.

Includes:

- workflow analysis
 - friction mapping
 - false digitization findings
 - outcome analysis
 - governance assessment
 - procurement implications
-

Public Accountability Summary

Simplified public-facing explanation.

Explains:

- what changed
 - what failed
 - where friction exists
 - whether outcomes improved
-

Task Force Roles

Task Force Lead

Responsibilities:

- overall diagnostic direction
 - independence enforcement
 - methodology integrity
 - executive coordination
-

Workflow Analyst

Responsibilities:

- journey mapping
- process decomposition

- escalation tracing
-

Friction Observer

Responsibilities:

- operational burden extraction
 - citizen experience observation
 - repetition analysis
-

Procurement Integrity Reviewer

Responsibilities:

- contract acceptance analysis
 - vendor independence review
 - accountability structure assessment
-

Outcome Verification Specialist

Responsibilities:

- before/after measurement
 - metric validation
 - operational consistency review
-

Procurement Integration

Recommended Contract Language

Projects should require:

An Independent Outcome Verification Report prior to final acceptance and payment.

Verification should include:

- measurable service outcomes
- workflow burden analysis
- citizen accessibility review
- operational consistency review

- post-deployment performance evidence
-

AI Governance Position

AI Placement Matters

The task force recognizes that:

- front-end automation can amplify citizen exclusion
- opaque back-end AI reduces accountability visibility
- AI without workflow reform reproduces administrative failure at scale

The task force evaluates:

- where AI is placed
 - what burden it creates
 - whether outcomes improve
 - whether accountability remains visible
-

Final Principle

Independent Outcome Verification Is a Missing Layer of Modern Governance

Auditors verify money.

Procurement verifies contracts.

IT verifies technical specifications.

But modern governments still lack a standardized independent mechanism to verify whether public outcomes actually improved after deployment.

The GL Government Diagnostic Task Force exists to fill that structural gap.
